ACKNOWLEDGEMENTS

R.N. Green, Heather Hedberg, Mike Coulthard, and Rob Madden (B.A. Blackwell and Associates Ltd.) completed data acquisition, analysis, and preparation. Greg Britton, Dennis Lloyd, Ray Coupé, Fred Nuszdorfer, Allen Banner, Tom Braumandl, Craig Delong, and Del Meidinger (Ministry of Forests) provided archived data and original plot data. Timberline Forest Inventory Consultants (Vancouver) compiled the data, while J.S. Thrower and Associates (Vancouver) prepared the Access program to process the data analysis. R.N. Green, Andy MacKinnon (Ministry of Forests), and Greg Britton wrote the text. Les Peterson (Ministry of Forests) assisted in document preparation. Andy MacKinnon conceived and coordinated the project.

Forest Renewal BC funded preparation of this report as part of the project "Old Growth Descriptions and Definitions for B.C." (Project Number HQ96370-RE).

1 INTRODUCTION

In 1975, the British Columbia Ministry of Forests began a program of ecosystem description, classification, and mapping. From 1975 to the present, more than 15 000 sample plots described vegetation, soils, and site characteristics following the methodology most recently described in Luttmerding et al. (editors, 1990).

Many of the data from these plots were used in ecosystem classification and mapping, and have been reported in published reports and field guides (e.g., http://www.for.gov.bc.ca/hfd/pubs/Docs/Srs/SRseries.htm). However, mensuration data collected from plots sampled between 1977 and 1981 have not previously been analyzed or reported. These mensuration data from late seral and old-growth forests provide stand structure data for site series described in the biogeoclimatic ecosystem classification (BEC).

This Working Paper reports on a project that addressed the following objectives:

- to gather all available mensuration data collected during the development of British Columbia's BEC into a cleaned, EcoBase[1]-compatible database; and
- to analyze the above mensuration data for site series statistics on:
  - tree diameter class distribution (live and dead),
  - tree species diversity, and
  - stems per hectare (live and dead).

2 MENSURATION DATA BACKGROUND

Mensuration data were collected as part of the standard ecosystem plot description used by the provincial ecology program beginning in the mid-1970s. The full suite of site, soil, vegetation, mensuration, wildlife, and range data was used to develop the BEC and related management interpretations.

Mensuration sampling focused on paired prism plots randomly located from the centre of the ecology plot. Tallied trees included all live and dead trees greater that 7.5 cm diameter breast height (dbh), and were measured for species, dbh, tree class, pathological remarks, and crown class. Tree heights were estimated for each tallied tree, although this was optional and not recorded in all plots. A subset of sample trees was also measured for age and height, which were used to estimate site index and determine stand age (Walmsley et al. 1980). In some cases, this methodology was modified, involving the use of single prism plots or fixed area mensuration plots. Generally, this took place early in the Ecology Program as data collection methods were being developed and finalized. Paired prism mensuration data were collected from 1977 to 1981, after which only site tree data were collected for site index estimation.

The mensuration data were intended to be compiled through a cruise plot compilation program developed by the Ministry of Forests Inventory Branch and adapted to the ecology data by Ministry of Forests Research Branch.

---

[1] The provincial Ecology Program database.

Compilation results included gross volume per hectare, stems per hectare, average volume per tree, average dbh, and average height, by species for each plot. Not all of the mensuration data were compiled. Compiled results were used to compute basic mensuration statistics (e.g., volume summaries) for site classification units that were used to varying degrees in developing management interpretations.

The mensuration data have received the least attention of all the BEC data collected and processed during the program. Only some of the data were entered into digital files, which were archived in various locations and formats. The coding conventions between regions and years in which data were collected are inconsistent. Also, because of format restrictions of the compilation program, plot numbers were truncated in all digital files so that they do not match the correct plot numbers used in EcoBase.

3 DATA ACQUISITION

3.1 LIBRARIAN Files

When data were processed with the mainframe computer, data files were routinely archived in the LIBRARIAN system. These files are relatively poorly organized, with their source and content cryptically referenced by a user password (the person who archived the files) and a 30-character description of file contents. Because this was a general data storage area, files were added sequentially over time and duplicate files were often included because they were stored more than once in different files or by different users.

3.1.1 Selecting files The master file listing for all LIBRARIAN files was carefully reviewed and all files that looked as if they may include ecology program mensuration data were highlighted. This assessment was based mainly on the password (regional ecology and pedology staff) and module description. These files were downloaded from the Branch server, then individually viewed to determine if the file contained mensuration data (based on the standard 80-column coding format used for mensuration data entry).

Mensuration files were located from the Cariboo, Nelson, Kamloops, and Vancouver regions. All data were entered during the 1978–1981 period. A total of 1477 plots (a plot represents a pair of prism cruise plots) were located in the LIBRARIAN files.

3.1.2 Plot number conversion Mensuration plot numbers (truncated from original plot numbers) were extracted from the data files and processed to derive the correct EcoBase plot number. To do this, the mensuration plot numbers were matched to correct plot numbers from associated site index or environment files obtained from the LIBRARIAN archives. These associated files were typically collected in the same year and region as the mensuration plots. The core component of each mensuration plot number was matched with the full correct numbers from the related file to establish the modification pattern used. The correct plot numbers were then re-created (Table 1). This process was used on all the LIBRARIAN files except for one Nelson file that required input from the regional ecologist to determine plot conversions.

TABLE 1 *Sample plot number conversion from Nelson Region*

Correct plot number from environment file	Matching mensuration plot number
$812068	$1A068
$812079	$1A079
K812089	K1A089
S812109	S1A109
Z812161	Z1A161

3.1.3 **Snags** Snags—dead and dead potential tree class—were tallied on the mensuration plot forms but were generally not captured in the digital LIBRARIAN files. Because of format restrictions in the standard 80-column file, tree class could not be included; as a result, only live trees were entered. However, in the Vancouver and Prince Rupert region files, snags were recognized through inclusion of a modified coding format.

Because data about snags were required for this project, we adopted a variable code 9 in the first existing pathological remark column to denote snags. Because we were focussing only on gross volumes, pathological remarks were not otherwise used in the analysis. In files where snags were included, whatever modified code was used was converted to the new code 9 format. For files where snags were not included, we obtained copies of the original field forms, highlighted all the plots containing tallied snags, then checked to see if snags were included in the data file. If yes, then the snag code was added; if no, the data were added along with the snag code. We found that in several cases dead trees were incorrectly included as live trees.

3.1.4 **Data format** Mensuration data from LIBRARIAN files were in the standard 80-column coding format (Table 2). This was modified to meet requirements of the compilation procedure (see section 2.3). The forest inventory zone (FIZ) was added so that the correct taper equations could be used in the compilation of volume. Forest inventory zones included coast (CO), southern interior (SI), and northern interior (NI). A new field for correct plot ID was added where the correct plot number that linked to the EcoBase data was entered. The revised coding format is shown in Table 3.

TABLE 2 *Standard coding format for mensuration files in LIBRARIAN*

Column	Description
1–7	Mensuration plot ID
8–9	Basal area factor
10–12	Tree height (decimal implied between 11 and 12)
13–14	Tree species
15–18	dbh (decimal implied between 17 and 18)
19–26	Pathological remarks
27–77	Repeat of columns 10–26 for up to three additional trees
78–80	Stand age

TABLE 3 *Revised coding format for mensuration files*

Column	Description
1–2	FIZ
3–9	Correct plot number
10–16	Mensuration plot ID
17–18	Basal area factor
19–21	Tree height (decimal implied between 20 and 21)
22–23	Tree species
24–27	dbh (decimal implied between 26 and 27)
28	Snag (code 9)
29–35	Pathological remarks
36–86	Repeat of columns 19–35 for up to three additional trees
87–89	Stand age

3.1.5 Stand age Stand age was entered only for some mensuration plots in the LIBRARIAN files. In some cases it was routinely missed, while in others it was entered only when below about 120 years for calculation of mean annual increment. Ages were added to the files for plots that were currently missing age and for which age data could be located on the original plot forms.

3.2 PC-based Files

Mensuration data that were entered after 1981 were not archived in LIBRARIAN and were found on Region/Branch PC storage format. This included all the Prince Rupert data and a portion of the 1977/1978 Kamloops data that was entered as part of an old-growth study (B.C. Ministry of Forests 1991). File formats included Lotus and text files that differed from the standard 80-column format. All of these data were converted to the revised text format, checked for consistency, and supplemented with snags where required. These files included the correct plot number and did not require further number conversion

3.3 Hardcopy File List

A portion of the Nelson 1977/1978 data was available only as a listing of the original LIBRARIAN file that was lost. These data were re-entered in the standard format, and processed as per other LIBRARIAN files described previously.

3.4 Original Plot Forms

Copies of original plot forms were retrieved from the regions for all plots that had mensuration data (paired prism plots only) that were not included in any of the available digital files. This included all of the Prince George data, plus additional data from the Kamloops, Cariboo, Nelson, and Vancouver regions. Where fixed-radius mensuration plots occurred, a record was maintained but the forms were not copied. These plots were not included in this project.

Data from the original plot forms were entered into Excel files that included all the original fields plus FIZ and unique plot number. These files were subsequently converted to the revised text format. All available age data were entered during this process.

3.5 Data Consistency

Once the files were modified to the revised format and snag data incorporated, they were checked for consistency. The main focus was tree species that were coded in the original files using both numeric and alpha codes. These codes were converted to the current standard two-letter tree species codes. In addition, files were visually checked and corrected for column misalignment and obvious data anomalies. The following issues were addressed:

- Column alignment was checked to ensure that all fields lined up correctly throughout all files.
- Anomalous basal area factor (BAF) values were identified. These turned out to be imperial prism BAFs that were used in Kamloops and Nelson in 1977/1978. These plots were separated for subsequent compilation.
- Anomalies in tallied tree numbers revealed a block of 1978 plots in the Prince Rupert data that were from fixed-radius plots. These plots were deleted from the data.
- Plots that had single rather than paired prism plots were identified and separated for compilation.
- Some duplicate plots were identified and deleted.

3.6 Data Summary

All of the mensuration data recovered are summarized in Table 4. Note that these represent numbers of ecology plots, each of which is represented by a pair of prism plots.

TABLE 4 *Summary of recovered mensuration plots*

Region	Number of plots	Years collected
Vancouver	391	1979–1980
Prince Rupert	847	1978–1982
Prince George	255	1979–1980
Nelson	1186	1977–1981
Kamloops	606	1977–1980
Cariboo	335	1979–1980
Total	3620	

4 DATA COMPILATION

The compilation program originally used for the ecology program data was no longer readily available, nor able to generate the stand and stock table data required for this project. All data were processed through the cruise compilation program of Timberline Forest Inventory Consultants.[2] The data were processed in batches by region. Coefficients for height/dbh relationships were computed from a minimum of 30 trees within each batch of data. Where heights were missing in the data, a height value was calculated from the tree's dbh using the empirical equation. The compiled results for each ecology plot represent the average of the two prism plots that were compiled separately.

---

[2] Timberline Forest Inventory Consultants Ltd., 401-958 West 8th Ave., Vancouver, BC V5Z 1E5.

During compilation, an internal error-checking routine identified a number of problems in the source data that required addressing. These problems included missing dbh or BAF, heights inconsistent with dbh, more than two subplots per plot, and anomalous BAFs. A careful review showed that most problems related to errors in the original data entry. All errors were addressed and the revised data resubmitted for compilation. After the data were successfully compiled, the results were verified internally to ensure that they had been processed correctly.

The compilation generated stand and stock data for each plot, including plot ID, species, and dbh class (5-cm classes, with class names representing the midpoint), with stems per hectare, gross volume per hectare, average height, quadratic mean dbh, basal area per hectare and snags per hectare by species and dbh class. Age was also generated where available in the source data. Data were output in a compact comma separated value (CSV) format that was imported into an Access database for subsequent analysis (Table 5).

TABLE 5 *Sample of Access database showing compiled results for plot $801900*

plotID	Sp	dbhClass	stemsHa	volHa	avgHt	qMdbh	baHa	snagsHa	age
$801900	Se	45	27.9328	40.9211	27	42.7	4	0	110

5 DATA ANALYSIS

5.1 Preparing the Database

5.1.1 Checking outliers After the compilation results were imported into the Access database, the data were checked for outliers that may indicate errors in the source data. Plot total volume per hectare was calculated and sorted for each batch (region) of data. Plots with unusually high and low volumes were assessed in relation to their site series and original source data to determine whether the values were reasonable. For example, a low-volume plot that occurred in a dense stand of small-diameter Bl, or in a low-productivity site series, was considered acceptable. The following issues were identified:

- **Nelson** – all data acceptable
- **Kamloops** – plot 790572 has high volume due to large diameter Cw with unusually tall heights. Because this plot was unclassified, it was left in the database.
- **Cariboo** – all data acceptable
- **Coast (Prince Rupert and Vancouver)** – all data acceptable. However, a number of plots appeared to have tree species inconsistent with their site series. For example, BS 019 is a high-volume Ss(Dr) stand but it is classified as MHmm2/02 site series. Although the EcoBase site series was not adjusted, this type of anomaly should be used to check the site series assignment.
- **Prince George** – all data acceptable

5.1.2 Checking plot numbers Plot numbers from the compiled data were matched with plot numbers in EcoBase to check for inconsistencies and missing data. Problems were encountered in the Kamloops data where differences in plot number format occurred within EcoBase and between EcoBase and the compiled plots. This related to the presence of a "0" or blank in some 1979 and 1980 plots. For example, plot 790506 occurred in EcoBase as both 79 506 (unsorted) and 790506 (sorted). Compiled plot numbers were compared to EcoBase plot numbers using the core components of the number. The correct EcoBase number was determined (if a number occurred twice, the "sorted" one was used). Plot numbers in the compiled data were adjusted accordingly.

A similar problem occurred in the Nelson data involving changes to the first character of the plot number in different years. The same plot may appear in three different versions with the core part of the number remaining the same but the first character changing (e.g., $796944 vs. C796944). These data were checked and adjusted using a similar process to that applied to the Kamloops data.

After correcting all the plot numbers, a number of plots were not found in the EcoBase plot list. These plots were reviewed but we could not explain why they were missing at this time. Also, a number of plots were found in the EcoBase database but were unsorted (no site series available). Table 6 summarizes the available plots. The total number of compiled plots is 138 fewer that the total number recovered from the available data sources. The difference reflects the plots that were deleted due to duplication within the database, as well as deletions due to problems identified during the various error-checking steps (e.g., missing BAF, missing tree species).

TABLE 6 *Summary of compiled mensuration plots in relation to the provincial database*

Category	Number
Total of compiled plots	3224
Number of compiled plots not found in EcoBase	52
Number of compiled plots found in EcoBase but not classified	495
Net compiled plots with site series data	2677

5.2 Creating an Age Table

Age data are required to analyze the mensuration data according to seral stage. Age data were available from two sources: ages included in the mensuration data, and ages included in the environment data within EcoBase. The data were extracted from the source files and merged into a new table in the database. Where a plot had age data from both sources, the mensuration ages were selected as the more reliable source. The final age table contained all compiled plots with an age value where available. An additional field called "seral stage" was added using the categories shown in Table 7.

The frequency distribution of age data for the compiled plots where data are available is shown in Figure 1. Figure 2 shows the distribution of plots according to seral stage. Plots in the mature age class dominate the database, with only a few samples in the early seral stage. This result reflects the sampling emphasis of the ecology program, which focused on older, stable successional stages. Of the total of 3224 plots, 2149 had age data.

TABLE 7 *Seral stage age classes*

Seral stage	Age
Early	< 40 years
Immature	40–100 years
Mature	101–250 years
Old	> 250 years

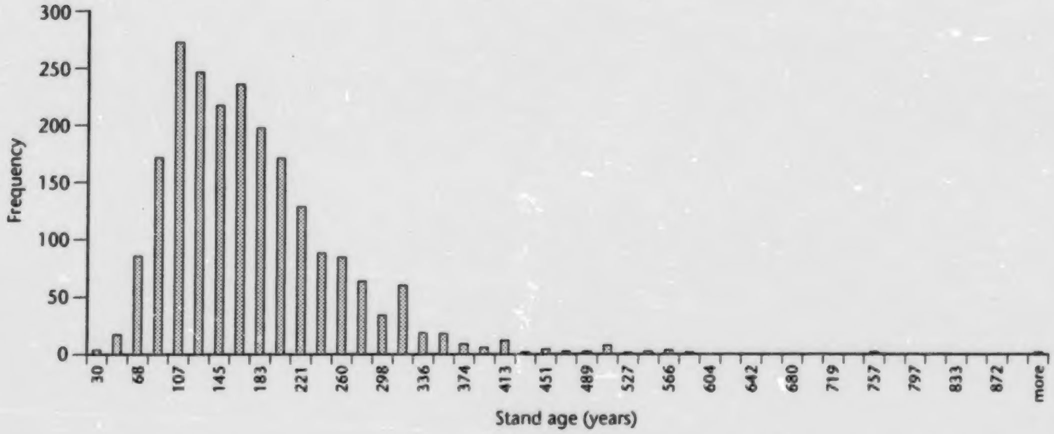

FIGURE 1 *Frequency distribution of available stand age data.*

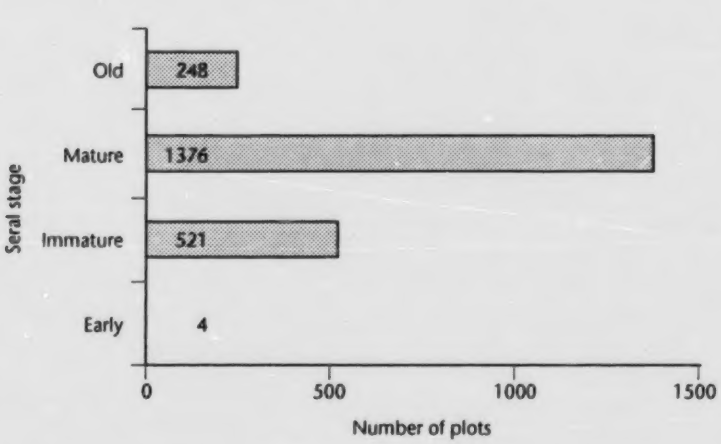

FIGURE 2 *Distribution of plots with age data according to seral stage.*

5.2.1 Adding a site classification table A table produced from the EcoBase database contained all unique ecology plot numbers (duplicate occurrences across regions deleted) together with the first occurrence of BEC unit (zone/subzone/variant/site series). The resulting table contained 19 918 plots, of which 12 163 had BEC unit information; the rest were unclassified. The list of compiled plot numbers was matched with this table to extract BEC unit data for all the compiled plots. These data were added as a separate table in the database. Of the total of 3224 plots, 2667 had site classification data (Table 6).

5.3 Description of the Final Database

The final mensuration database contains three tables with the following data (Table 8). All tables are linked by PlotID.

Plots were allocated to site series based on January 2000 sorting instructions. The database was analyzed to identify the portion that will be used for computing mensuration statistics for site series. This analysis includes plots that have both age and BEC unit data. Of the 3224 compiled plots, a total of 1787 meet these requirements.

TABLE 8 *Description of tables contained in the mensuration database*

Table name	Description
AGE	PlotID with age and seral stage (where available) for 3224 compiled plots
ALL-BEC	PlotID for 3224 compiled plots with matching EcoBase plot number, and BEC unit (where available)
ALL-REGIONS	Compiled mensuration data for all 3224 plots

5.4 Analysis of Site Series Stand and Stock Tables

The final Access database described above was analyzed to generate site series–specific stand and stock tables. A series of queries, tables, and forms was designed to allow the user to specify analysis of various combinations of variable, site series, seral stage, and minimum sample size. The Variable options include stems per hectare, volume per hectare, basal area per hectare, and snags per hectare. All site series for which data were available are included in the BEC unit options, while the four seral stages (Table 7) are included in the Seral Stage option. Once the analysis parameters are set, a report can be generated on the screen or the printer. If no data are available for that combination of parameters, a warning is issued in the screen output. This warning is disabled in the printer output to allow batch printing of multiple analyses. For example, to print all tables for volume per hectare for mature seral stage, select all the BEC units, and select printer report. Figure 3 displays the principal Access windows, including the database tables and the main form window where analyses are selected and reports generated.

The output for each analysis includes the selected parameters (site series, seral stage, variable), and the total average, standard deviation, and sample size. A table displays the averages of the variable by species and diameter class. The data from the table are graphically summarized below the table. Appendix 1 contains output for all combinations of variable, site series, and seral stage where data were available with a minimum sample size of five. These data can be rerun with a different minimum sample size if required.

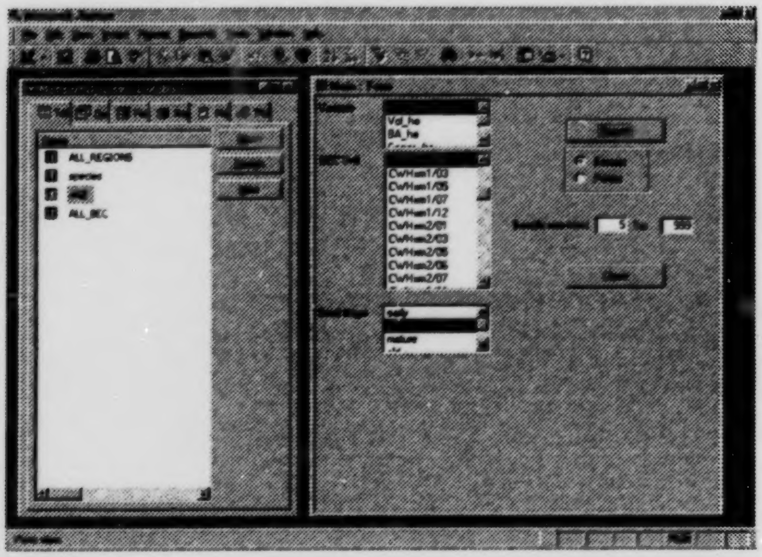

FIGURE 3 *Window from Access database showing parameter options for analysis.*

5.5 Analysis of Zone, Variant, and Site Series Volume and Snag Data

The volume and snag data by biogeoclimatic zone (zonal site series), variants within a zone (zonal site series), and the range of site series within a variant were analyzed. The analysis included only the mature seral stage and was restricted to a sample size of five or greater. The intent was to assess the results in terms of expected trends based on ecological characteristics. Table 9 summarizes the results for the CWH, ESSF, ICH, IDF, MS, and SBS zones. Table 10 summarizes the results for five variants with the CWH zone, while Table 11 summarizes results for five site series within the CWHvm1.

The ranking of zones according to average stand volume closely follows the relative productivity potential based on climatic limitations. The lowest volumes occur in the ESSF zone, the most climatically limiting of these zones, while the highest volumes occur in the least climatically limiting CWH zone. The ICH has slightly lower volumes than the CWH, which is consistent with its relatively moist, warm continental climate. The lower volumes of the IDF and SBS are consistent with their relatively drier and cooler

TABLE 9 *Summary of volume and snags for selected biogeoclimatic zones*

		Volume/ha		Snags/ha	
Zone	n	Mean	SD	Mean	SD
BWBS					
CWH	62	746.7	153.7	81.3	83.2
ESSF	82	417.9	65.0	214.7	120.7
ICH	63	659.5	136.5	114.7	60.1
IDF	42	513.4	45.5	93.9	104.6
MS	18	617.0	144.1	247.5	164.2
SBS	76	488.8	28.8	197.2	128.5

TABLE 10 *Summary of volume and snags for selected variants of the CWH zone*

		Volume/ha		Snags/ha	
Variant	**n**	**Mean**	**SD**	**Mean**	**SD**
CWHvh2	19	486.2	236.4	227.7	236.4
CWHms2	6	752.4	226.9	59.6	50.4
CWHwh1	8	795.9	191.7	19.7	15.1
CWHws2	10	810.9	293.6	49.7	54.2
CWHvm1	19	888.2	344.3	50.0	50.4

TABLE 11 *Summary of volume and snags for selected site series of the CWHvm1 variant*

		Volume/ha		Snags/ha	
Site series	**n**	**Mean**	**SD**	**Mean**	**SD**
CWHvm1/03	6	494.8	336.0	35.7	37.6
CWHvm1/06	7	698.1	272.8	299.5	576.2
CWHvm1/01	19	888.2	344.3	50.0	50.4
CWHvm1/08	6	969.0	344.6	51.5	60.8
CWHvm1/07	11	1019.4	281.5	101.2	205.1

climates, respectively. Snag densities were highest in the ESSF, SBS, and MS zones, with the lowest snag densities occurring in the CWH zone.

Within the CWH zone, the CWHvm1 ranks the highest, again reflecting the most productive climate for tree growth in Canada. The CWHws2, CWHms2, and CWHwh1 are slightly lower due to the submaritime influence in the first two units, and the lower productivity associated with the higher latitude of the latter unit. Lowest volumes occurred in the CWHvh2, one of the least productive of the CWH units. Snag densities were relatively consistent in all the variants except the CWHvh2, which had high densities of redcedar snags associated with the poorer-quality sites.

The general trends in relative volume of site series of the CWHvm1 showed lowest volumes in the dry site series, intermediate volume for the zonal site series, and highest volumes for the moist and rich site series. The CWHvm1/06 site series had atypically high snag densities relative to other units that represented smaller-diameter western hemlock and redcedar. These plots may have represented the poorer range of the 06 where more snags would be expected.

In general, the trends in the mensuration statistics are relatively consistent with the anticipated trends based on ecological characteristics. This finding provides some assurances about the overall reliability of the data. Significant departures from expected trends would have raised some uncertainties about the quality of the data.

5.6 Outstanding Issues

The stand and stock table data should be reviewed to identify obvious inconsistencies between the tree species present and the BEC unit. For example, plot BS 019 appears to be incorrectly classified because it is an Ss(Dr) stand classified as MHmm2/02 site series. Other site classification problems may be revealed this way.

Errors that were not identified during the various error checks may still occur in the source data. Also, the occasional error in plot numbers may occur due to the confusing variations in numbering formats that occurred in some of the data.
